DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/1/04 has been entered.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1, 3-19, 21-33, 35, and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Haefner et al in view of either Zhu et al (6044296 or 5843136).

Art Unit: 3762

Haefner meets the limitations of the term "reduced capacitance". In addition, Haefner describes figure 1 as a dual chamber cardioverter/defibrillator with pacing capability (col 3, ln 45) being able to operate in the unipolar or bipolar sensing modes having atrial and ventricular tip and ring electrodes, a can indifferent electrode, and a metallic housing. Haefner further describes in figure 2 the use of a system in the bipolar mode using the tip and ring electrodes and indifferent can electrode and meets the electrode combination limitations of claims 3, 4, 6, 11, 15, 21, 22, 24, 29, and 33.

But Haefner et al disclose the claimed invention except for the other different particular combinations of unipolar or bipolar sensing between atrial electrodes (tip and/or ring), ventricular electrodes (tip and/or ring), and case/can electrodes, for a system to sense between all combinations of any two electrodes and the afterpotential means comprising a first capacitor for attenuating afterpotentials coupled to a second capacitor for blocking DC components and including switching means for selectively coupling the capacitors in series to reduce the effective capacitance. Either Zhu teaches that it is known to have the afterpotential means comprising a first capacitor for attenuating afterpotentials coupled to a second capacitor for blocking DC components and including switching means for selectively coupling the capacitors in series to reduce the effective capacitance to allow the system to quickly sense evoked responses after pacing. In addition, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the implantable electrical therapy device using unipolar and bipolar sensing as taught by Haefner, with an equivalent afterpotential means comprising a first capacitor for attenuating afterpotentials coupled to a second capacitor for blocking DC components and including switching means for selectively coupling the capacitors in series to

Art Unit: 3762

reduce the effective capacitance as taught by either Zhu and with different combinations of unipolar or bipolar sensing between atrial electrodes (tip and/or ring), ventricular electrodes (tip and/or ring), and case/can electrodes for a system to sense between all combinations of any two electrodes since it was known in the art that unipolar or bipolar sensing between atrial electrodes, ventricular electrodes, and case/can electrodes are used in a system to sense between all combinations of any two electrodes and is used in pacemakers, defibrillators, and ICD's to sense heart activity and that particular configurations are chosen depending on the implantation of the leads and the sensing of the particular heart condition(s). In addition, it was known in the art that systems attenuating afterpotentials use the afterpotential means comprising a first capacitor for attenuating afterpotentials coupled to a second capacitor for blocking DC components and including switching means for selectively coupling the capacitors in series to reduce the effective capacitance and allow the system to quickly sense the evoked response after pacing.

Response to Arguments

Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection. A terminal disclaimer was previously filed to overcome the double patenting rejection in view of either Zhu. For applications filed on or after November 29, 1999, the 103 rejection might be overcome by showing that the subject matter of the reference and the claimed invention were, at the time the invention was made, owned by the same person or subject to an obligation of assignment to the same person. See MPEP § 706.02(l)(1) and § 706.02(l)(2).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to George R Evanisko whose telephone number is 571 272 4945.

The examiner can normally be reached on M-F 6:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Angela Sykes can be reached on 571 272 4955. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
